MoveWire

An AI financial participant for international students

Topic C · Tuition, living funds and private sponsor coordination

---

Team: add contestant names and university affiliations before submission.

The student problem

Tuition is only one part of the financial decision.

Students must balance currency conversion, payment timing, living costs and family support.

Research hypothesis: a guided, auditable task reduces uncertainty. User-study results are not yet claimed.

One task, end to end

“Help me prepare my tuition payment.”

Compare fresh routes → check deadline and reserve → prepare → owner approves → sandbox execution.

The demo uses illustrative USD-to-GBP quotes and fictional account records.

The AI does useful work

Bounded financial tools and planning edits.

Compare tuition routes · Simulate rent changes · Stress-test FX · Prepare a payment proposal. Save requested planning edits; confirm declared funding changes.

The model has no approval or execution capability. Each tool is bound to the authenticated student.

Protect time and living costs

The cheapest route must also meet the student’s plan.

A shared decision engine checks quote freshness, buffered arrival and available cash. Deadline and reserve checks run at preparation and execution.

Blocked routes explain the funding top-up. UTC weekdays exclude holidays and university processing; arrival is an estimate.

Approval means exact terms

One proposal. One recipient. One quote.

Owner approval covers provider, recipient, rate, fee, amount, expiry, deadline and reserve. Provider changes require reset and fresh approval.

Source quotes expire in ten minutes; proposal expiry never extends them. AI preparation never grants authority to pay.

Execution you can inspect

A receipt backed by a financial ledger.

Atomic wallet debit + ledger entry + UUID receipt + audit. A retry returns the original receipt without another debit.

Chat shows recorded calculations. Evidence exports include proposals, tool results, actor timestamps and before/after balances. No external settlement is claimed.

Privacy and security

Students control sponsor access and AI processing.

Purpose-limited sponsor views · Revocable AI consent · Server-only API secret · Allowlisted tools · Account ownership checks · Daily AI limits.

Known limits: no MFA, no real payee/KYC verification, fallible model prose and no independent security audit.

Validation

Show the tests and the actual journey.

208 local regression checks · Responsive browser checks · Authenticated live AI preparation, owner approval, sandbox execution and receipt. Evidence includes deadlines, authorization and recorded calculations.

Exact results are in docs/validation.md. Local tests mock the model; the recorded live journey uses a fictional development account and sandbox funds. One trial does not establish overall success rates.

Next milestones

From a defensible sandbox to verified integrations.

Student usability study · Provider sandbox integration · University rules and holiday calendars · Broader multilingual and adversarial evaluations.

The submission demonstrates a bounded financial task, with human control and auditable execution.
