MoveWire

An AI finance assistant for international students

Topic C · Tuition, living funds and private sponsor coordination

---

Team: add contestant names and university affiliations before submission.

The student problem

Tuition is only one part of the financial decision.

Students must balance currency conversion, payment timing, living costs and family support.

We aim to make tuition decisions easier to understand. A student study has not yet been completed.

One task, end to end

“Help me prepare my tuition payment.”

Compare fresh routes → check deadline and reserve → prepare → student approves → simulated payment.

The demo uses illustrative USD-to-GBP quotes and fictional account records.

The AI does useful work

Useful tools with clear limits.

Compare tuition routes · Simulate rent changes · Test currency changes · Prepare a payment proposal. Save requested planning edits; confirm declared funding changes.

The model has no approval or execution capability. Each tool uses the logged-in student’s records.

Protect time and living costs

The cheapest route must also meet the student’s plan.

The app checks quote expiry, delivery time with a safety buffer, and available cash. It checks the deadline and living reserve before preparation and again before sending.

Blocked routes explain the funding top-up. UTC weekdays exclude holidays and university processing; arrival is an estimate.

Approval means exact terms

One proposal. One recipient. One quote.

Student approval covers provider, recipient, rate, fee, amount, expiry, deadline and reserve. Provider changes require reset and fresh approval.

Source quotes expire in ten minutes; proposal expiry never extends them. AI preparation never grants authority to pay.

Execution you can inspect

A receipt backed by a financial ledger.

The wallet debit, ledger entry, receipt, and audit record are saved together. Sending again returns the same receipt without another debit.

Chat shows recorded calculations. Evidence exports include proposals, tool results, actor timestamps and before/after balances. No external settlement is claimed.

Privacy and security

Students control sponsor access and AI processing.

Students choose sponsor access · AI consent can be withdrawn · API keys stay on the server · Only approved tools run · Account and daily limits.

Known limits: no MFA, no real payee/KYC verification, AI explanations can be wrong and no independent security audit.

Validation

Show the tests and the actual journey.

211 local tests · Responsive browser checks · Authenticated live AI preparation, owner approval, sandbox execution and receipt. Evidence includes deadlines, authorization and recorded calculations.

Exact results are in docs/validation.md. Local tests mock the model; the recorded live journey uses a fictional development account and sandbox funds. One trial does not establish overall success rates.

Next milestones

Test with students, then connect real services.

Student usability study · Provider sandbox integration · University rules and holiday calendars · More language and misuse tests.

The demo shows a complete simulated payment with student approval and records that can be checked.
